Anonymization and Upload Process

Published | https://help.omnisient.com/en/articles/10110433-anonymization-and-upload-process

The Upload process is initiated by the command in the section above, either typed directly in a command line, or initiated by a script which can be scheduled at regular intervals.

Once initiated, the exact process as with the Omnisient Desktop Connect data onboarding application is executed. All the fields marked as PII (information that can uniquely identify an individual) are tokenised, anonymized and salted before any data

leaves the client's server environment. Only anonymized tokens are held on the Omnisient platform and used for analysis and campaigns.

All access to uploaded data is managed by the client as described in the data management section below. The system is built with privacy-by-design principles and will even detect potential personal information contained in fields not marked as

PII by the client.

Anonymisation, Tokenisation and Upload Process

Omnisient is the inventor of the Secure Compounded Matching (SCM) Token process, a hybrid cloud approach using artificial intelligence to solve for issues relating to anonymisation & matching in privacy by design platforms. Using SCM, tokens can

be matched across any PII field with security features iteratively embedded into the tokens to make them incredibly difficult to break. The technology is future proofed to accommodate for any new advancements in cryptography.

The process below is followed once Server Connect is started either manually, or via a scheduling tool at specified intervals:

[Image]

Note that the data is hashed not only on the Client's premises but also once uploaded into the Omnisient cloud to ensure bad actors cannot re-identify any uploaded, tokenized, and hashed personal data.

Column Matching in the Omnisient Platform

Published | https://help.omnisient.com/en/articles/10855699-column-matching-in-the-omnisient-platform

What is Column Matching?

Column Matching is a core feature of the Omnisient platform that allows users to compare and find common data points between multiple datasets. This process enables businesses to securely collaborate on data without exposing personally identifiable information (PII).

How Does Column Matching Work?

- **Uploading Datasets:**
- Users upload datasets to the Omnisient platform via the Desktop Connect or Server Connect application.
- Data is anonymized and tokenized before being processed.
- **Selecting Matching Columns:**
- Users choose specific columns for matching, typically fields containing encrypted identifiers.
- Matching can be done on direct matches or "best match" scenarios for fields like names, phone numbers, or addresses.
- **Overlap Matching & Early Warnings:**
- Omnisient’s Overlap Project feature allows users to compare their dataset with another dataset to identify common records.
- A warning system alerts users if there are no common PII fields between datasets, preventing unnecessary processing■.
- **Transforming Data for Matching:**
- Data undergoes validation, standardization, and tokenization to ensure a secure matching process.

- Errors in PII fields are flagged so users can clean and re-upload data if necessary■.

- **Processing the Match:**

- The system processes the overlap and generates insights on the matched records.

- Users can then use the matched data for further analysis or collaboration without ever exchanging raw data■.

Benefits of Column Matching

- **Enhanced Privacy:** All PII data is anonymized and tokenized before processing, ensuring compliance with data privacy laws.

- **Seamless Collaboration:** Organizations can share insights without exposing raw data.

- **Efficiency:** The early warning system prevents mismatches and improves overall match accuracy.

If you need assistance setting up a dataset match don't hesitate to contact support.

Desktop 2.0 Upload via file

Published | https://help.omnisient.com/en/articles/9188210-desktop-2-0-upload-via-file

Here's a step-by-step guide on how to upload your datasets to the Omnisient platform:

- **Login via Desktop Connect:** Access the Omnisient platform through Desktop Connect using your credentials.
- **Click on "Upload Data":** Once logged in, navigate to the "Upload Data" section.
- **Choose "Upload a New Dataset":** Select the option to upload a new dataset to begin the process.

[Image]

- **Name Your Dataset:** Provide a name for your dataset to easily identify it within the platform.
- **Specify Data Type and PII:** Indicate the type of data you're uploading and whether it contains Personally Identifiable Information (PII).
- **Select Anonymization Preferences:** Choose the anonymization method you prefer, such as anonymizing and re-identifying with a unique ID or Omnisient ID, or anonymizing only.
- **Continue and Choose Data Source:** Proceed to the next step and select your data source file from your computer, or opt for database connection to upload via a database.
- **Set Delimiter and Preview Data:** Specify the delimiter used in your file and preview the data to ensure it appears as expected.

[Image]

- **Choose Customer Identifier:** Select the customer identifier from your dataset to uniquely identify customers.
- **Preview and Choose Columns:** Review the data preview and select which columns to upload, identifying those containing PII, dedupe identifiers, and the category of PII fields.

[Image]

- **Click on Finish:** Once satisfied with your selections, click on "Finish" to initiate the upload process.

[Image]

- **Data Processing:** Your dataset will undergo hashing and cryptography processes to ensure PII is removed before being uploaded to the Omnisient platform.

[Image]

By following these steps, your datasets will be successfully uploaded to the Omnisient platform, ready for analysis without any Personally Identifiable Information.

Desktop Connect 2.0 upload via Database

Published | https://help.omnisient.com/en/articles/9329410-desktop-connect-2-0-upload-via-database

Desktop Connect Onboarding Application: Installation

Published | https://help.omnisient.com/en/articles/7019155-desktop-connect-onboarding-application-installation

Please download the Onboarding Application: **Omnisient Desktop Connect** onboarding desktop installer at the following URL:

RSA: http://omnisient.com/installer?region=za

UAE: http://omnisient.com/installer?region=uae

[Image]

Please follow the installation wizard through to the end.

- Once the **Setup.Exe file is downloaded**, click on it. (You will find it on your screen, or in your Download Folder):

- Select **Install**: Setup.EXE at the bottom

[Image]

Once the install the installation is completed the app will auto-launch and you will be presented with the login screen:

[Image]

Use the credentials sent to you via our welcome email. Search for **“Omnisient Welcome”** in your email inbox. The Desktop Connect upload screen will follow, and you can proceed through the prompts.

Desktop Installation Troubleshooting FAQ

Published | https://help.omnisient.com/en/articles/7019202-desktop-installation-troubleshooting-faq

These are some of the possible issues faced during the installation of the Desktop Connect onboarding application.

- **Failure to download or run the install file: Omnisient**

This may be caused by your antivirus or firewall blocking the download.
Click “keep”, “save anyway” or “run anyway” as needed.

FMCG Customer Intelligence Hub

Published | https://help.omnisient.com/en/articles/12699660-fmcg-customer-intelligence-hub

The **FMCG Customer Intelligence Hub** project is designed to provide deep, privacy-safe consumer insights tailored to the South African market. This project allows you to securely compare and analyze your own customer data alongside data from a large retailer using Omnisient's secure platform.

This article explains what the FMCG Customer Intelligence Hub is, who it's for, and how to start using it effectively.

Who Is This For?

This guide is intended for:

■ FMCG companies operating in South Africa

■ Data analysts and marketing teams

Prerequisites

Before you can use the FMCG Intelligence Hub, ensure:

- You have an active Omnisient subscription for this product. If not, please contact our Sales Team to get started.
- You have a valid dataset that includes valid PII (required for matching).

Step-by-Step Instructions

1. Upload Your Dataset

Use either **Desktop Connect** or **Server Connect** to upload your dataset:

- Your dataset must contain valid PII such as ID, mobile number, or email address.
- All PII is automatically anonymized and tokenized on your device before upload, in line with POPIA and GDPR.

2. Log into Omnisient

Visit app.omnisient.com and log in using your credentials.

3. Start a New Project

Navigate to **Projects Dashboard** and click on **Create New +**. Then:

- Select the **FMCG Customer Intelligence Hub** template.
- Choose the dataset you'd like to use. This must be one that contains valid PII.
- Your dataset must first be registered in the system.

4. Analyze Data

Use built-in tools to explore the data:

- **SQLPad**: For structured query and transformations.
- **Jupyter Notebook** (if enabled): For more advanced, code-based exploration.

Tips and Best Practices

- Always ensure your selected dataset includes clean, validated PII for the best overlap results.
- Regularly update your datasets to reflect recent customer information.
- Leverage Jupyter or SQLPad for more custom analytics.

Troubleshooting

- **Upload failed?** Make sure the file format and headers follow Omnisient's data preparation standards.
- **Access issues?** Confirm with your administrator that you have permissions for SQLPad, Jupyter, and project creation.

Need Help?

Reach out via the Help widget on the platform, or contact support at support@omnisient.com.

How to Share an Audience to an Ad Account

Published | https://help.omnisient.com/en/articles/11069246-how-to-share-an-audience-to-an-ad-account

This guide covers the two ways to share an audience with a connected ad account on Meta or TikTok from a project selection or from a marketplace segment.

Before you start

- **To connect an ad account:** You must have an **Admin** role. Ad accounts are connected per user and are only accessible to the user who authenticated them.
- **To create and share a selection:** You must have an **Owner** or **Read and Write** role on the project. Admins have Read and Write access by default.
- **Dataset prepared for activation:** The dataset used in your audience must have been marked as Activation Ready during Desktop Connect or Server Connect processing. If this step was skipped, the dataset will need to be re-uploaded and reprocessed. See Preparing a dataset for campaign activation.

Step 1: Connect your ad account

If your ad account is already connected, skip to Step 2.

[Image]

- Navigate to **Ad Accounts** under the **Admin** section.
- Select the activation platform you'd like to connect **Meta** or **TikTok**.
- Follow the on-screen instructions. You'll be redirected to authenticate the account on the selected platform.
- Once connected, link the **ad account** associated with that platform.

■ **TikTok:** Accept all requested permissions during authentication. If permissions are changed or declined at any point after setup, the share **will fail** and will require re-authentication to resolve.

[Image]

Step 2: Share your audience

Choose the path that matches how your audience was created.

From a project selection

Create your selection

- Go to **Projects** and open the project where you want to build your audience.
- Confirm your project type supports audience selections. Compatible types include:
- Overlap
- ACE
- Collaborative ACE
- Manual ACE
- Rainmaker Attribution
- **Make Selection** using the action on the Selections panel
- Set your **Customer Base** and configure your filter criteria using the selection builder.
- For (■) **Intended Use**, select **Activate via Supported Channels**.
- Assign a friendly name and complete the selection setup.
- Your selection will go through an internal review. Once approved, it will appear under the **Selections** tab in your project.

■ **Important:** Selecting Export or Save Criteria as the intended use will produce an audience that cannot be pushed to an ad platform.

[Image]

Share to your ad account

[Image]

- Open the approved selection to access its detail view.
- Scroll to the **Activation Channels** section.
- Click **Share to ad account**. A panel will appear.
- Select **Add ad account**.
- In the setup modal:
- Select the **ad account** you'd like to share to.
- Assign a **Friendly Name** to help identify this activation across multiple campaigns or projects.
- Select your **Matching Fields**. These are the fields that Meta or TikTok will use to match your audience:
- Email
- Phone Number
- Including both fields maximizes your match rate. Meta and TikTok use OR logic, so a record only needs to match on one field to be included.
- Submit the request.

You can add multiple ad account destinations from this view.

From a marketplace segment

Marketplace segments are predefined audiences available within the platform for activation.

[Image]

- Navigate to **Marketplace**.
- Select the **Market Segment** you want to activate.
- Open the activate audience modal and complete the ad account details:
- Select your connected ad account.
- If you're activating on behalf of a client or another organization, check **"**Are you creating this audience for someone else?**"** and enter the client's name. This name is included in the audience name so the activation can be easily identified.
- Assign a **Friendly Name**.
- Submit the request.

■ Matching fields are pre-configured and optimized for each segment so there is no match-field selection required.

[Image]

Once submitted, the segment will surface in **Audience Manager**.

What to expect

After submitting, your audience goes through an internal review before being handed off for delivery. You can track progress in the **Activation Channels** section of your selection (project path) or in **Audience Manager** (marketplace path).

Status

What it means

Requested

Submitted and under internal review.

Rejected

Did not pass the review. You can revise and resubmit, or contact support.

Working

Approved and actively being synced to your ad platform.

Completed

Successfully synced. The audience is ready to use in your campaigns.

Failed

The sync was not successful. You'll receive an email with the reason and recommended next steps.

For a full breakdown of each status and how to respond to failures, see Understanding the audience activation lifecycle.

How to access the log files in Desktop Connect V2

Published | https://help.omnisient.com/en/articles/9867157-how-to-access-the-log-files-in-desktop-connect-v2

Steps to follow to access the log file:

- Right-click on the desktop icon and select "Open file location"

[Image]

- Navigate to the logs folder

[Image]

- You can now see the files

[Image]

Minimum System Requirements

Published | https://help.omnisient.com/en/articles/8684027-minimum-system-requirements

Web Application:

A standard web browser (e.g., Chrome, Safari, Firefox, Edge)

Recommended System Requirements for Desktop App Installation:

- **Operating System:**
- Windows 10 64-bit

(If you don't have a Windows machine, consider using a Windows Virtual Machine.)

- **RAM:**
- 8 to 16 GB (depending on the size of the files you intend to upload)
- **Processor:**
- Intel® Core™ i5 or better
- **Hard Drive Space:**
- At least three times the size of the largest raw file you plan to upload
- **Minimum requirements:**
Desktop Connect v2
- CPU: Intel i5
- RAM: 8GB (Data batch and no of columns dependant, but customizable)
- OS: Windows (Mac OS in-progress)

Server Connect

- CPU: Intel i5
- 8GB RAM (Data batch and no of columns dependant, but customizable)
- OS: Windows/Linux/Mac See supported versions below:
- https://github.com/dotnet/core/blob/main/release-notes/6.0/supported-os.md
- Requires .NET Core 6 SDK

These recommended requirements will help ensure a smooth experience when using the desktop application. Please adjust your system specifications accordingly based on your specific usage and file size needs.

Preparing a Dataset for Campaign Activation

Published | https://help.omnisient.com/en/articles/10357440-preparing-a-dataset-for-campaign-activation

If a dataset may be used for campaign activation, it must be marked as **Activation Ready** during processing in Desktop Connect or Server Connect.

■ Activation refers to sharing a dataset with an advertising platform (e.g., Meta or TikTok) to create matched audiences for targeted campaigns.

Where to Enable Activation

During dataset configuration in Desktop Connect or Server Connect, locate the **Use Dataset for Campaign Activation toggle** and enable it before completing processing.

[Image]

Enabling the Activation-ready toggle ensures the dataset is technically prepared for this downstream use.

You should enable Activation if the dataset will be:

- Used by your organization for targeted advertising campaigns
- Shared with a partner who will use the dataset for campaign activation

■■ If Activation is not enabled during processing, the dataset will not be compatible for campaign activation later and will need to be re-uploaded and reprocessed.

Activation Prerequisites

Required Dataset Fields

To prepare a dataset for activation, it must include at least one of the following fields:

- **Email**
- **Phone number**

You may include one or both.

Including **both Email and Phone** is recommended to maximize match rates on activation platforms, but only one is required.

Legal Permission to Use This Data for Advertising

You confirm that:

- You have a valid lawful basis (including any required consents or permissions) to use the dataset for targeted advertising
- Individuals have been appropriately informed
- You honor opt-outs and other data subject rights
- You are permitted to share the data for audience matching under applicable laws and advertising platform terms

■ **In short:**
You are legally allowed to use and share this data for campaign activation.

Your Organization Has the Proper Agreement with Omnisient

You confirm that:

- Your organization has the required agreement(s) in place with Omnisient (e.g., MSA, OPLA, Order Form, and/or DPA)
- These agreements authorize the use of the dataset for activation and targeted advertising
- This use complies with any contractual restrictions

■ **In short:**
Your organization is contractually authorized to activate this data.

Sequential Column Name for Server Connect

Published | https://help.omnisient.com/en/articles/9241826-sequential-column-name-for-server-connect

The Sequential Column Name is a field required to be present in all Server Connect upload source files (but not Desktop Connect).

It should contain a unique sequential number for that field and is used by Server Connect to keep track of the latest record processed between multiple uploads.

It does not have to be in any sorted order.

TransUnion Cleanroom Analytics

Published | https://help.omnisient.com/en/articles/12585292-transunion-cleanroom-analytics

This article guides Data Buyer users through creating a **TransUnion Cleanroom Analytics** project on the Omnisient platform. This project template enables secure overlap and non-overlap analysis between your customer dataset and TransUnion's Universe dataset, with access to built-in business intelligence (BI) visualizations and advanced analytics via SQLPad and Jupyter Notebook.

This article is for Data Buyer client users who want to:

■ Understand the overlap between their customer base and TransUnion's data universe

■ Gain insights through default dashboards and advanced data analysis tools

■ Maintain full data privacy and compliance using SMPC and anonymization processes

Prerequisites

Before you begin:

- Your customer dataset must be uploaded and prepared (via Desktop Connect, Server Connect, or SQLPad)
- A data sharing collaboration must exist between your company and TransUnion
- Your dataset should include a valid ID Customer Identifier and pass all anonymization checks

Step-by-Step Instructions

1. Log into the Omnisient Web App

Go to https://app.omnisient.com and sign in with your credentials.

2. Access the Projects Module

From the left-hand navigation, click on **Projects**, then select **Create New**.

3. Choose the "TransUnion Cleanroom Analytics" Template

In the project template selection modal, locate and select **TransUnion Cleanroom Analytics**.

Note: This template will only be available if you have an active subscription for it. Contact Omnisient Support if it's not available.

4. Enter Project Details

- **Project Name**: Provide a name relevant to your analysis (e.g., “TU Overlap Oct 2025”)
- **Description** (optional): Add a description for your reference or team visibility

5. Select Your Customer Dataset

- Choose your prepared dataset from the list

6. Submit and Process

Click **Submit** to initiate the project. The system will:

- Generate anonymized match results and populate your project workspace

Exploring Results

Once processing is complete, access your project to view:

- **Pre-built BI Dashboards**: Visual insights on overlap, penetration, and non-overlap
- **Advanced Tools**:
- **SQLPad**: Write queries against the joined dataset
- **Jupyter Notebook**: Perform deeper data science tasks

Tips and Best Practices

■ Review your dataset schema in advance to confirm correct identifiers and formats

■ Use SQLPad to create additional tables or custom aggregations

■ For in-depth modeling, request Jupyter access from your Admin

■ Document your analysis steps for reproducibility and team collaboration

Troubleshooting

- **Unable to Use Template**: Ensure your subscription is enabled for TransUnion Cleanroom

Analytics. Contact your Account Manager.

- **No Overlap Found**: Recheck that your dataset includes tokenized identifiers compatible with TransUnion's universe

- **Access Issues with SQLPad or Jupyter**: Make sure you're assigned to the project with the correct access level

For further assistance, please reach out to support@omnisient.com or use the in-app help chat.

Adding South African Company Registration Number as a PII Field

Draft

Introduction

This article explains how to use the newly added **South African Company Registration Number** field as a **Personally Identifiable Information (PII)** type on the Omnisient platform.

This enhancement improves local compliance and enables better dataset configuration for South African businesses.

Target audience: Data uploaders, administrators, and data privacy officers operating under South African regulatory frameworks.

Overview of the New PII Field

Omnisient now supports **South African Company Registration Number** as a recognized PII field. This field accommodates both legacy and modern formats and is available in both Desktop Connect and Server Connect applications.

Field Availability by Region

- This PII type is **only visible to tenants registered in South Africa**.
- If your account is not registered in the South African region, the field will not appear during the mapping or transformation steps.

Supported Formats for Validation

The platform automatically validates two formats for South African company registration numbers:

Format Type

Structure

Example

Post-2002

YYYY/NNNNNN/NN

2021/123456/07

Pre-2002

XYYYY/NNNNNN

X1999/654321

Post-2002 CIPC Format Validation

Expected Pattern

YYYY/NNNNNN/NN

- YYYY = year (2008 → current year)
- NNNNNN = exactly 6 digits
- NN = 2-digit entity type (e.g., 07 = Private Company)

Your validation checks

✔ Regex must match the pattern

✔ First 4 characters must be numeric (year)

✔ Year must be ≤ current year

✔ Input must contain exactly **two slashes**

✔ All other characters must be digits

Old / Regional Format Validation

Expected Pattern

XYYYY/NNNNNN

- X = a single alphabetic region code
- YYYY = year (≤ current year)
- NNNNNN = 6 digits

Your validation checks

✔ Regex must match the old/regional pattern

✔ First character must be a **letter**

✔ Next 4 must form a valid year

✔ Input must contain **one slash**

✔ All remaining characters (after the first letter) must be digits or a slash

If a record does not conform to either format, it will be flagged during the transformation step for further review.

Using the New PII Type in Upload Apps

Desktop Connect

- **Step 2 – Select PII Fields**: The system's machine learning engine will suggest this field if the format is detected.
- **Step 3 – Map Fields**: Choose SA Company Registration Number from the Omnisient Category dropdown.
- Continue with the transformation and upload steps as usual.

Server Connect

- During schema configuration via the Configurator, import fields from your source file or database.
- Mark the registration number column as a PII field.
- Assign the SA Company Registration Number category.
- Save your configuration and schedule or run the upload.

Validation and tokenization will be performed automatically in both tools, with compliance and security ensured.

Tips and Best Practices

- **Always double-check** format compliance before upload to avoid validation errors.
- **Limit exposure** by only including registration numbers when necessary for matching or enrichment.

Desktop Connect Onboarding Application: Data Upload - File

Draft

In this section we will briefly explain how you will use **Desktop Connect**, the Omnisient Windows-based desktop application to select your data, tokenise and cryptographically protect any personal identifier information (PII), and upload the secure, anonymous data to the Omnisient Platform.

Data Preparation

Please see the “Data Preparation Format” extract for details about what your upload files should look like.

First prepare your file or table for upload, then initiate the upload app for securing and uploading it to the Omnisient platform.

Login

After installing the Omnisient Desktop Connect app, begin by launching the application in the windows start menu.

Please note the application will auto-update on launch if necessary. Kindly allow the update to be completed, then login using the user credentials sent to you in your welcome email.

[Image]

Navigating between Omnisient Apps

You can easily navigate between the Omnisient Desktop, Web, and Extractor apps – no need to remember or save the links to launch them – just click the link at the top:

[Image]

The Desktop Connect Upload process

After signing into the Desktop Connect app, you will work through five steps to secure and privatize your dataset prior to upload; the final step being the actual upload itself. The picture shows the first page that you will see, with the steps indicated in the progress bar near the top:

[Image]

Step 1 – Select Source

During this step you will point the app to your source data.

Dataset Name Please provide a name for your dataset once it is on the platform, and adhere to the following standards:

- No more than 64 characters
- No spaces
- Alpha and Numeric characters only
- No special characters (for example &*!#) There are two source options for your files – a flat file, or an SQL table.

Source Option 1 - File:

Your source file should be in CSV format (Pipe delimited) or TXT format (Tab delimited).

[Image]

Please select

- Your prepared file containing the dataset you would like to upload.
- Type in a name for your uploaded dataset
- Click “Browse”
- Choose your upload file from the wizard file picker This will auto-populate a preview as shown below

[Image]

Dataset Type

The dataset type can be one of four options:

Customer

Customer data, generally containing one record per customer, with PII fields that need to be anonymized.

The Criteria

- Contains PII
- Can include a customer identifier, unique within the client's environment, to be used when linking to other internal tables

Transactional

Data relating to transactions or payments by customers (e.g., retailer sales or insurer statements)

Criteria

- Does not contain PII
- Contains a customer identifier

Dimension

Data providing more descriptive information on specific items in other internal tables (e.g., product description, branch names, and locations)

Criteria

- Does not contain PII
- Does not contain customer identifier

Other

Any data set that doesn't fall into the top 3 categories.

Transaction Type

Transaction Type can be one of two options:

Evaluate Only

Omnisient allows for the re-identification of individuals (only within your own environment) to permit data enrichment, audience selections and so forth. This is achieved in one of two ways – with the

Omnisient iURN mechanism, or with your own internal record identifier. When Evaluate Only is selected, this is only possible via your own internal record identifier. No Omnisient iURN (record or row identifier (not an identifier of an individual)) will be saved for you, in your environment, for each record. This option can be used if you are uploading your own, client-specific record identifier to be used internally to link a consumer's record across different systems, databases, and files. This identifier must not be anonymized.

Trade

Selecting Trade will save a unique iURN per record, which can be used to match back every record, allowing for the re-identification of individuals. This will enable, within the required consent framework, data enrichment, audience selections, and so forth.

PII Category: Additional ID Number

Draft

Omnisient has expanded its **Personally Identifiable Information (PII)** classification use cases. The following new PII fields are now available across our apps and platform:

■ **Additional ID Number**

This update supports the use of multiple ID Number columns, enabling scenarios such as linking medical aid dependents or spouses.

What This Means for Users

1. Support for Multiple ID Numbers

- Users can now select **one primary ID Number** and **multiple Additional ID Number** fields during dataset uploads, improving flexibility for complex identity use cases.

2. Seamless Platform Integration

- The new "Additional ID Number" field is available across the platform, including:
- Classifying PII fields in **Desktop Connect**
- Configuring schemas in **Server Connect**
- Adding or editing schemas in the **Web App**

[Image]

3. Privacy-First Data Handling

- All ID numbers - primary and additional - are fully anonymized and tokenized before leaving the user's environment, secured by Omnisient's **Secure Multi-Party Computation (SMPC)** framework, ensuring they are never shared in raw form.

Next Steps for Users

✔ **Review Your Datasets** - Update your **dataset schemas** to classify these fields correctly.

✔ **Update Data Mapping & Upload Processes** - Ensure that these fields are correctly mapped and tokenized before use in any analysis or collaboration.
